Marsden Point

6 April 2022

Channel Infrastructure releases blueprint for lower-carbon energy transition

Channel Infrastructure, New Zealand's largest fuel import terminal based at Marsden Point in Northland, has today released its inaugural sustainability report: *Our Transition to a Sustainable Future*. The report outlines the company's response to the impacts of Climate Change on our business, as well as the opportunities and risks we see from the energy transition that is taking place in New Zealand.

Commenting, CEO Naomi James said:

"We know the world is warming and that carbon emissions from human activity, including transport, is contributing to this. As a business that forms a critical part of New Zealand's energy supply chain, we have a role to play in responding to this challenge and playing our part to support New Zealand's shift to a lower-carbon economy. And that is exactly what we plan to do."

On 1 April, the company completed the shutdown of New Zealand's only oil refinery and shifted to an import terminal; we have now received the first shipments of imported refined fuel products to our Marsden Point site.

Ms. James added:

"We have chosen to be part of the broader energy transition in New Zealand and leaned into the changes that were necessary for our business. There is never an ideal moment to transition, especially when people's jobs are at stake. But we have also been clear from the start: the way we respond to climate change is about more than just bringing down emissions. It is about supporting people who are affected, and doing our part to mitigate the impact on individuals, and our community."

"At the same time, we must keep fuel affordable and available for everyone, throughout the energy transition. As a country, we can't pursue an 'at any cost' commitment to lower carbon energy, especially when energy costs are already at peak levels. We need to be doing more to ensure that in the future there is a mix of fuel options to meet the differing needs and choices of consumers, which keeps fuel affordable and available for everyone."

"Channel Infrastructure is committed to using Marsden Point's highly strategic assets and infrastructure to support New Zealand's shift to a lower-carbon economy. With our change to an import terminal, our customers can now access lower-carbon sources of fuel, from newer, larger and more efficient refineries, and lower carbon shipping options – opening up more choice for how we reduce transport fuel emissions."

Channel Infrastructure has strong growth aspirations to support New Zealand's changing future fuel needs, with opportunities being pursued at the Marsden Point site including additional fuel storage to support fuel security, renewable electricity supply through the Maranga Ra solar project and work underway with customers and partners on biofuel and hydrogen opportunities.

The report is aligned to international TCFD reporting standards, more than a year sooner than required, and is one of the first acts of the company following last week's transition to Channel Infrastructure.

About Channel Infrastructure NZ

Channel Infrastructure is New Zealand's leading fuel infrastructure company.

Channel Infrastructure owns critical infrastructure, supplying the Northland and Auckland markets, which make up 40% of New Zealand's fuel demand and all of the jet fuel to the Auckland International Airport. Utilising the deep-water harbour and jetty infrastructure at Marsden Point, as well as 280-million litres of storage tanks, and the 170-kilometre pipeline from Marsden Point to Auckland we import, store, test and distribute fuel owned by our customers. Channel Infrastructure's wholly-owned subsidiary, Independent Petroleum Laboratories, provides quality fuel testing services at Marsden Point and around New Zealand.

Channel Infrastructure is well positioned to support New Zealand's changing future fuel needs, with growth opportunities at the Marsden Point site including additional fuel storage to support fuel security, renewable electricity supply through the Maranga Ra solar project and work underway with customers and partners on biofuel and hydrogen opportunities.
